What each prior work actually computes for a drone-scale target

Rows: every reference-library paper that puts a target through a scattering or signature computation, plus the ambiguity-law owners, plus this work. Every cell is graded: quoted from a PDF, computed by us, or UNVERIFIED.

	Ray engine	Target mesh	Material model	Aspect-resolved RCS	Rotor motion	Diffraction	Amplitude validation	Geometry mono/bi/multi	Unambiguous velocity

● capability present ◐ partial ○ absent – not applicable ? UNVERIFIED - not backed by a primary source

row groups: scattering computed from a target geometry; target in a ray-traced scene, no scattering integral; measurement-based signature anchor; ambiguity law, no target scattering; this work

Every cell is graded: quoted verbatim from a PDF re-checked at build time, computed by us from a JSON or a full-text term count, or derived from a quoted cell in the same row (not-applicable calls only).
