

DJI Matrice 4E hovering, 3.5 GHz, belly view — the same 60 ms window through three engines. Blade flashes repeat every 7.9 ms.

24-sample Hann segments = 0.61 blade periods (208 Hz resolution), hop 2 (0.40 ms) = 139 time slots, 8x zero-padded. Zero Doppler is the body. All three panels share the slow-time grid, the rotor speeds and the display convention, so only the scattering engine differs. Time resolution is deliberately favoured over frequency resolution: segments shorter than one blade period are what make the flash arches visible at all. Maps are normalized to their own peak, so this figure compares structure, not level.
